SHIVANG

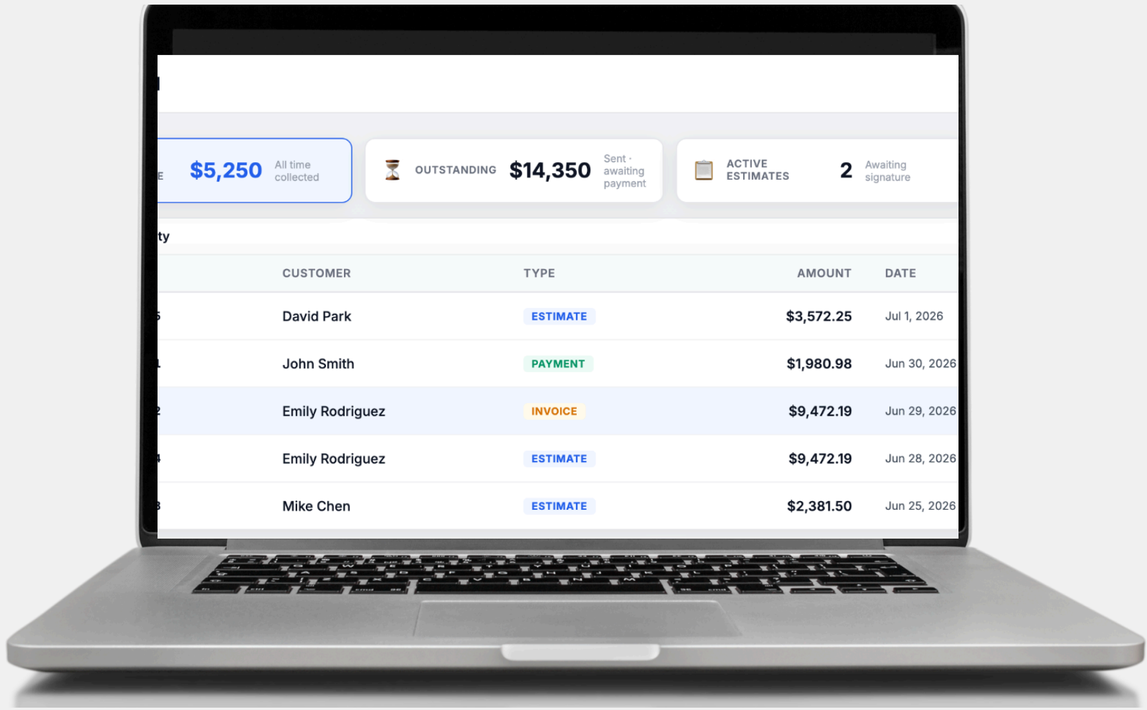

The Intent : Solving for the 'Why'

I believe great product userflow is invisible. My approach starts with a deep dive into user psychology and data to ensure that every step serves a purpose. I don’t build for trends; I build for utility, accessibility, and long-term impact.

PM Case Study

Cadence

Overview

“ Estimate → signed → invoice → paid. One flow. One record. Zero re-keying. ”

Cadence Documents is a native document lifecycle module built inside HighLevel, designed to help field-service SMBs close faster and get paid sooner. Through **AI-powered document creation**, **native e-signatures**, and **automatic invoice generation**, Cadence eliminates the fragmented tool-stack — Estimate tool + DocuSign + invoicing platform — that costs SMBs time, money, and closed deals.

Every document flows directly from the Deal record. No data re-entry, no tool-switching, no dropped balls. The customer signs in the same session the estimate is built. The invoice is created the moment signature is confirmed.

HighLevel

What are we solving?

Meet Mike: An HVAC contractor managing a 12-person crew. Great at the job, drowning in paperwork. Losing deals while waiting on DocuSign callbacks.

The Problem

Field-service SMBs juggle three separate tools for one transaction: estimate, DocuSign, invoice. Every handoff means re-keyed data, friction, and $25–45/user/month in extra costs.
Deals stall waiting on signatures. Invoices go out late. Revenue leaks at every seam.

Cadence Documents unifies the entire flow together - estimate, e-sign, and invoice in one place. AI builds the document in a click, native e-sign replaces DocuSign, and the invoice generates automatically from the signed record.
No re-keying. No tool-switching. Done before Mike drives home.

Empathy Map

What does he think and feel?

"I spend more time on paperwork than actual jobs." "If I quote today and they don't sign for a week, I've already lost two other jobs." "I trust my gut on pricing — I don't trust an AI to handle my contracts." "My crew waits while I chase e-sign confirmations."

What does he hear?

"Software tools are too complicated for field guys like me." His bookkeeper says DocuSign is fine. Peers say Cadence is powerful but has a learning curve.

What does he see?

Competitors closing deals faster with slicker tools. His own estimate template in Excel. DocuSign email threads. A separate invoice tool. Colleagues using all-in-one platforms he has never set up.

What does he say and do?

"I'll get to the paperwork tonight." Sends estimates late. Forgets to follow up. Loses track of which version the customer signed. Calls the office three times to confirm an invoice was sent.

Pain

Deals lost to slow paperwork, double-entry errors, $45/mo DocuSign overhead

Gain

One-click docs + instant e-sign + auto-invoice = faster close, no DocuSign bill

HighLevel

User Persona

"I want to send the estimate, get it signed, and send the invoice — all before I drive back to the shop."

Biography

Mike runs an HVAC contracting business with 8–12 field technicians. He quotes 10–15 jobs per week, signs agreements via email attachments, and invoices via QuickBooks. Every extra tool is a tool he has to teach his admin.

Demographics

AGE : 32 - 52

BUSINESS OWNER

METRO CITY

INCOME : <5 LPA

Goals and Needs

Mike needs to quote, get signed, and invoice within the same hour — ideally from his phone. He wants the system to remember his line items, apply his logo automatically, and confirm when the customer has signed.

Pain Points

DocuSign costs $45/mo. Estimates lost in email threads. Invoices created manually hours after the job. Customers forget to sign. Three different tools mean three places for things to go wrong.

Motivations

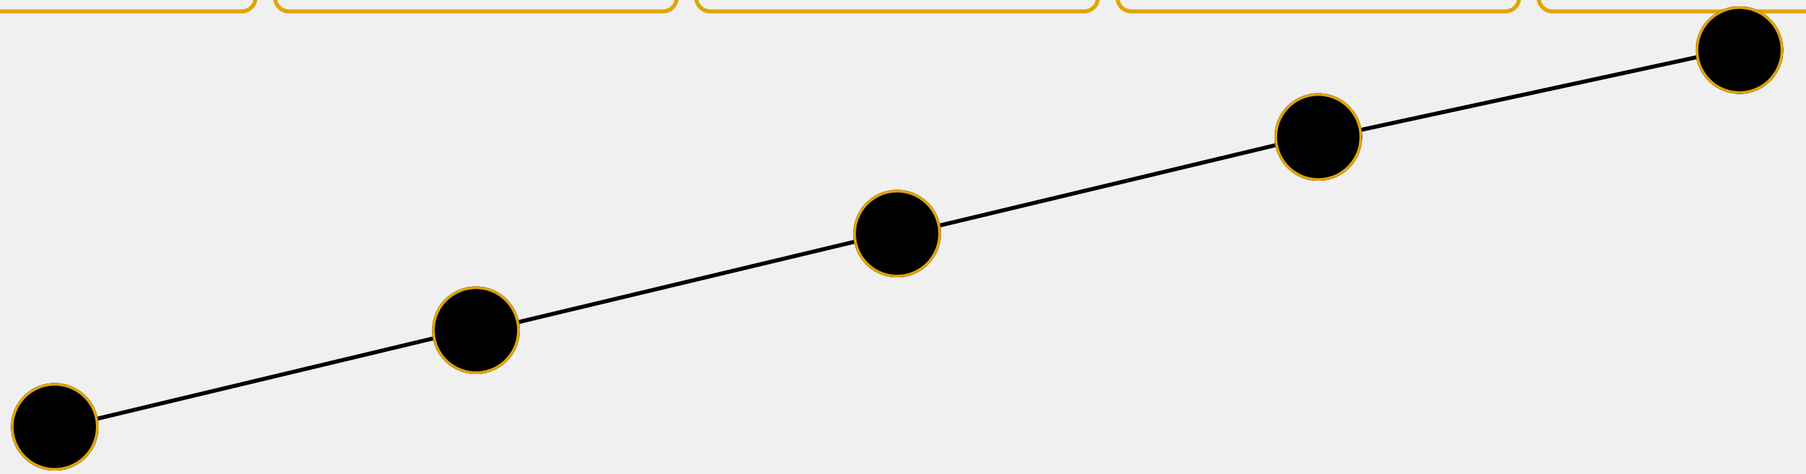

Mike is driven by a desire to look professional and move fast. He wants to win more jobs by responding before competitors. Getting a signed estimate and invoice out the same day feels like a competitive superpower.

Desired Outcome

Mike wants to wake up Monday with a queue of pre-filled estimates ready to send, a clear view of what's signed vs. outstanding, and invoices that go out automatically when the job is marked done.

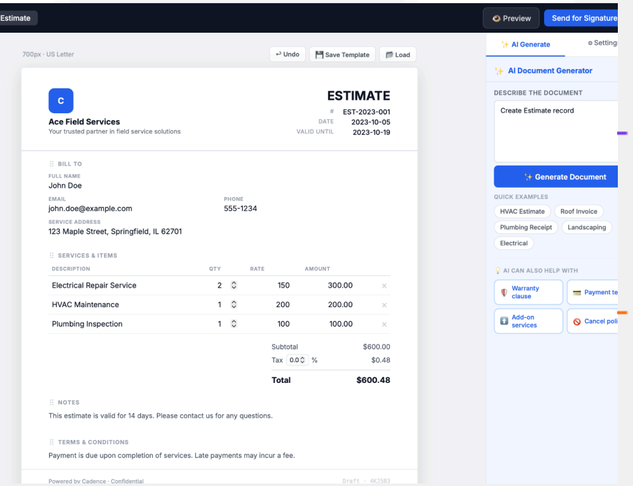

User Journey

Phase	Estimate	Build Doc	E-Sign	Invoice	Paid
Action	**Estimate**	**Build Doc**	**E-Sign**	**Invoice**	**Paid**
	AI pre-fills from estimate record: name, address, line items & totals. Brand applied automatically.	One click generates a professional branded doc. Review, toggle sections, add terms - then send.	Customer receives link, signs on any device. SHA-256 hash + timestamped audit trail auto-created.	Signed estimate instantly generates invoice. Amount locked to signed doc. Send with one click.	Customer pays via embedded link. Auto-receipt sent. Record marked Paid in dashboard.
Touchpoint	CRM Record	Doc Builder	E-sign Link	Invoice Email	Payment Portal

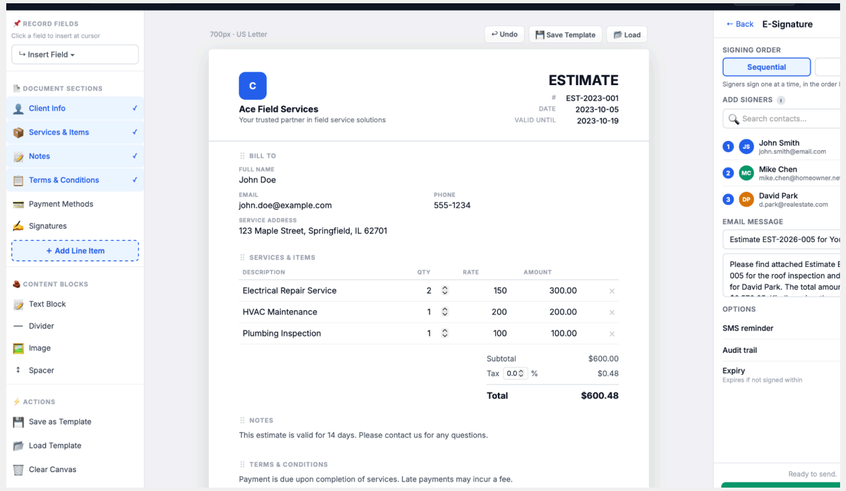

Cadence Documents

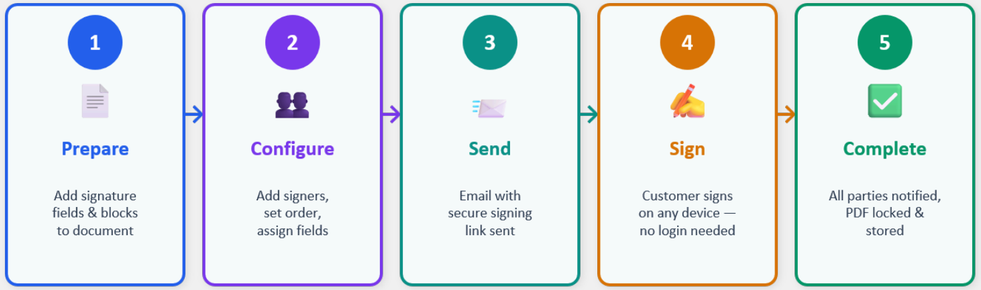

AI Document Builder

1. Pre-fills from estimate record — one click
2. Section toggles — include only what the job needs
3. AI suggests warranty upsells & terms by job type
4. Brand settings (logo, colors) auto-applied from account
5. "Send for Signature" gated until doc is complete

Native e-signature

AI Builder: Real acceleration, not a gimmick

Design principle: AI reduces decisions — it does not add them. Every AI touchpoint should save a click, not create one.

✅ Genuine AI acceleration

📋 Pre-fill document from estimate record — name, address, line items, totals in one click

🏷️ Apply company branding (logo, colors, fonts) automatically from account settings

💡 Suggest warranty upsells & payment terms based on job type and line items

📝 Generate professional email subject & body when sending for signature

⚠️ Flag missing fields before send — no email on file means no signature possible

❌ Where AI would be a gimmick

✍️ "AI-write" the entire document — customers sign what their business says, not AI filler prose

🎨 Auto-design templates without brand input — generic output that undermines the business's identity

🤖 AI chat interface for document editing — adds an interaction step, doesn't remove one

🔮 AI pricing suggestions — field techs know their rates; AI guessing creates liability and distrust

Ship Estimate + E-Sign first

Why this wedge first

Highest customer pain

Every field-service SMB feels DocuSign friction. Removing it delivers immediate, visible relief.

Directly displaces a paid tool

DocuSign costs $25-45/user/month. Native e-sign eliminates that cost — a real retention driver.

Creates pipeline into the rest

A signed estimate naturally triggers invoice generation — the wedge pulls the whole flow.

Deliberate phase 1 exclusions:

Invoice builder, Payment flows, Receipt generation — important but secondary. Estimate + E-Sign is the trust-builder. Once users trust Cadence with signatures, the rest follows.

Phase 1 · Weeks 1–4

AI Document Builder

- Estimate record → professional document in one click
- AI pre-fill, brand auto-apply, section toggles

Phase 2 · Weeks 5–8

Native E-Sign

- Multi-signer flow, sequential order, audit trail
- Customer signs via link — no login required

Phase 3 · Weeks 9–12

Invoice + Payment Flow

- Invoice auto-generated from signed estimate
- Embedded payment link, auto-receipt on payment

Impact & Metrics

Expected outcomes within 90 days of launch

65%

Faster close cycle

From multi-day DocuSign wait to same-session signature. No more deals going cold overnight.

$45

Monthly savings / user

Full DocuSign plan eliminated. Delivers immediate, measurable ROI on Day 1 of rollout.

40%

Fewer support tickets

Automated status updates + receipts close the loop. No more "where's my invoice?" calls.

Why this approach wins:

- One continuous flow: Estimate → signed → invoice → paid. Data entered once.
- AI removes work, not adds it. Every touchpoint saves a click, not creates one.
- E-sign built in — no DocuSign dependency, no redirect, no extra subscription.
- Data reconciles: signed amounts = invoice amounts = payment amounts.
- Start small, win big: Estimate + E-Sign first — highest pain, direct displacement.
